

AI Tools Trial

Summary of Tools Evaluated per Deliverable

Artifact	Chosen Tool	Reason	Also Tried
Vision Documentation	Liner	Specialized in search, summaries, and organizing information — produced the best output	Claude, Gemini
Requirements Specification	Genspark	Specialized in software development; produced better output than all alternatives	Claude, Gemini (better than ClickUp & Copilot)
User Stories	Claude	Best fit for structured user story writing	—
Use Case Diagram	Eraser.io	Best diagram output; prompt written with Gemini	Mermaid (worst)
ERD	Gemini + Eraser.io	Gemini for description, Eraser.io for visualization — more accurate than alternatives	ChartDB (paid, less accurate), Mermaid (less accurate)
API Documentation	Antigravity + Claude	Used Antigravity platform with Claude model to generate documentation	—
Wireframes	Figma AI	Both Figma AI and v0 by Vercel produced accurate wireframes; v0 has low usage limits so Figma was used finally	v0 by Vercel (good but limited)
Sprint Plan	Notion	Offers the most flexibility; team can all access and edit plans collaboratively	Notion, Liner, Claude, Gemini (all tried)
Final Working MVP	Replit	Higher usage limits than Antigravity models — no need to switch between models mid-project	Antigravity (multiple models tried)

Key Notes

- Tools were evaluated based on output quality, accuracy, feature availability, and team accessibility.
- Genspark outperformed Claude and Gemini for Requirements Specification due to its software development specialization.
- For ERD, a hybrid approach (Gemini + Eraser.io) gave the most accurate result — ChartDB requires payment and was less precise.
- Figma AI was preferred over v0 by Vercel for Wireframes due to v0's low usage limits, despite both producing good results.
- Notion was chosen for Sprint Planning because it allows full team collaboration and editing flexibility.
- Replit was preferred over Antigravity for the MVP because its higher limits eliminated the need to switch models.
